SSH

Yunohost handles most of the SSH configuration but some manual intervention is still needed to improve security:

Add users

By default, only `admin` can connect and we need to manually add other users (Tuto):

```
yunohost user ssh allow <USER>
```

Disable password authentication

Tuto:

```
PasswordAuthentication no
Match Address 192.168.0.0/16,10.0.0.0/8,172.16.0.0/12,169.254.0.0/16,fe80::/10,fd00::/8
        PermitRootLogin yes
        PasswordAuthentication yes
```

Change port

As the UpNP handles port forwarding, we cannot obfuscate the ssh port from the router. We need to change the server's configuration (Tuto):

```
sudo nano /etc/ssh/sshd_config
    port <PORT>
sudo yunohost firewall allow TCP <PORT>
sudo yunohost firewall disallow TCP 22
sudo nano /etc/fail2ban/jail.d/my_ssh_port.conf
    [sshd]
        port = <your_ssh_port>

    [sshd-ddos]
        port = <your_ssh_port>

sudo yunohost firewall reload
sudo systemctl restart ssh
sudo systemctl restart fail2ban
```
